

M5M4416P-12, -15

65 536-BIT (16 384-WORD BY 4-BIT) DYNAMIC RAM

DESCRIPTION

This is family of 16384-word by 4-bit dynamic RAMs, fabricated with the high performance N-channel silicon-gate MOS process, and is ideal for large-capacity memory systems where high speed, low power dissipation, and low costs are essential. The use of double-layer polysilicon process technology and a single-transistor dynamic storage cell provide high circuit density at reduced costs, and the use of dynamic circuitry including sense amplifiers assures low power dissipation. Multiplexed address inputs permit both a reduction in pins to the standard 18-pin package configuration and an increase in system densities. The M5M4416P operates on a 5V power supply using the on-chip substrate bias generator.

FEATURES

- Performance ranges

Type name	Access time (max) (ns)	Cycle time (min) (ns)	Power dissipation (typ) (mW)
M5M4416P-12	120	220	175
M5M4416P-15	150	260	150

- 16,384 x 4 Organization
- Industry standard 18-pin dual in line package
- Single 5V $\pm 10\%$ supply
- Low standby power dissipation: 25mW (max)
- Low operating power dissipation:
 - M5M4416P-12 275mW (max)
 - M5M4416P-15 250mW (max)

PIN CONFIGURATION (TOP VIEW)

- All Inputs, outputs TTL compatible and low capacitance
- 3-State unlatched outputs
- 128 refresh cycles/2ms. Pin 10 is not needed for refresh
- Early write or $\overline{OE}$ to control output buffer impedance
- Read-Modify-Write, $\overline{RAS}$ -only refresh, Hidden refresh and Page mode capabilities
- Wide $\overline{RAS}$ pulse width for Page mode 30 μ s max

APPLICATION

- Refresh memory for CRT

BLOCK DIAGRAM

65 536-BIT (16 384-WORD BY 4-BIT) DYNAMIC RAM

FUNCTION

The M5M4416P provides, in addition to normal read, write, and read-modify-write operations, a number of other functions, e.g., page mode, $\overline{\text{RAS}}$ -only refresh, hidden refresh, and delayed-write. The input conditions and output states for each are shown in Table 1.

Table 1 Input conditions for each mode

Operation	Inputs						Input/Output		Refresh	Remarks
	$\overline{\text{RAS}}$	$\overline{\text{CAS}}$	$\overline{\text{W}}$	$\overline{\text{OE}}$	Row address	Column address	Input	Output		
							DQ	DQ		
Read	ACT	ACT	NAC	ACT	APD	APD	OPN	VLD	YES	Page mode identical
Write (Early Write)	ACT	ACT	ACT	DNC	APD	APD	VLD	OPN	YES	
Read-modify-write	ACT	ACT	ACT	ACT	APD	APD	VLD	VLD	YES	
$\overline{\text{RAS}}$ -only refresh	ACT	NAC	DNC	DNC	APD	DNC	DNC	OPN	YES	
Hidden refresh	ACT	ACT	DNC	ACT	APD	DNC	OPN	VLD	YES	
Standby	NAC	DNC	DNC	DNC	DNC	DNC	DNC	OPN	NO	

Note. ACT active, NAC nonactive, DNC don't care, VLD valid, APD applied, OPN open.

SUMMARY OF OPERATIONS

address (AO through A7)

Fourteen address bits are required to decode 1 of 16,384 storage locations. Eight row-address bits are set up on pins AO through A7 and latched onto the chip by the row-address strobe ($\overline{\text{RAS}}$). Then the six column-address bits are set up on pins A1 through A6 and latched onto the chip by the column-address strobe ($\overline{\text{CAS}}$). All addresses must be stable on or before the falling edges of $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$. $\overline{\text{RAS}}$ is similar to a chip enable in that it activates the sense amplifiers as well as the row decoder. $\overline{\text{CAS}}$ is used as a chip select activating the column decoder and the input and output buffers.

write enable ($\overline{\text{W}}$)

The read or write mode is selected through the write enable ($\overline{\text{W}}$) input. A logic high on the $\overline{\text{W}}$ input selects the read mode and a logic low selects the write mode. The write enable terminal can be driven from standard TTL circuits without a pull-up resistor. The data input is disabled when the read mode is selected. When $\overline{\text{W}}$ goes low prior to $\overline{\text{CAS}}$, data-out will remain in the high-impedance state allowing a write cycle with $\overline{\text{OE}}$ grounded.

data-in (DQ1 through DQ4)

Data is written during a write or read-modify write cycle. Depending on the mode of operation, the falling edge of $\overline{\text{CAS}}$ or $\overline{\text{W}}$ strobes data into the on-chip data latches. These latches can be driven from standard TTL circuits without a pull-up resistor. In an early-write cycle, $\overline{\text{W}}$ is brought low prior to $\overline{\text{CAS}}$ and the data is strobed in by $\overline{\text{CAS}}$ with setup and hold times referenced to this signal. In a delayed write or read-modify-write cycle, $\overline{\text{CAS}}$ will already be low, thus

the data will be strobed in by $\overline{\text{W}}$ with setup and hold times referenced to this signal. In delayed or read-modify-write, $\overline{\text{OE}}$ must be high to bring the output buffers to high impedance prior to impressing data on the I/O lines.

data-out (DQ1 through DQ4)

The three-state output buffer provides direct TTL compatibility (no pull-up resistor required) with a fan-out of two Series 74 TTL loads. Data-out is the same polarity as data-in. The output is in the high-impedance (floating) state until $\overline{\text{CAS}}$ is brought low. In a read cycle the output goes active after the access time interval $t_a(\text{C})$ that begins with the negative transition of $\overline{\text{CAS}}$ as long as $t_b(\text{R})$ and $t_b(\text{OE})$ are satisfied. The output becomes valid after the access time has elapsed and remains valid while $\overline{\text{CAS}}$ and $\overline{\text{OE}}$ are low. $\overline{\text{CAS}}$ or $\overline{\text{OE}}$ going high returns it to a high impedance state. In an early-write cycle, the output is always in the high-impedance state. In a delayed-write or read-modify-write cycle, the output must be put in the high impedance state prior to applying data to the DQ input. This is accomplished by bringing $\overline{\text{OE}}$ high prior to applying data, thus satisfying t_{OEHD} .

output enable ($\overline{\text{OE}}$)

The $\overline{\text{OE}}$ controls the impedance of the output buffers. When $\overline{\text{OE}}$ is high, the buffers will remain in the high impedance state. Bringing $\overline{\text{OE}}$ low during a normal cycle will activate the output buffers putting them in the low impedance state. It is necessary for both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ to be brought low for the output buffers to go into the low impedance state. Once in the low impedance state, they will remain in the low impedance state until $\overline{\text{OE}}$ or $\overline{\text{CAS}}$ is brought high.

65 536-BIT (16 384-WORD BY 4-BIT) DYNAMIC RAM

Page-Mode Operation

This operation allows for multiple-column operating at the same row address, and eliminates the power dissipation associated with the cycling of $\overline{\text{RAS}}$, because once the row address has been strobed, $\overline{\text{RAS}}$ is maintained. Also, the time required to strobe in the row address for the second and subsequent cycles is eliminated, thereby decreasing the access and cycle times.

Refresh

Each of the 128 rows ($A_0 \sim A_6$) of the M5M4416P must be refreshed every 2 ms to maintain data. The methods of refreshing for the M5M4416P are as follows.

1. Normal Refresh

Read cycle and Write cycle (early write, delayed write or read-modify-write) refresh the selected row as defined by the low order ($\overline{\text{RAS}}$) addresses. Any write cycle, of course, may change the state of the selected cell. Using a read, write, or read-modify-write cycle for refresh is not recommended for systems which utilize "wired-OR" outputs since output bus contention will occur.

2. $\overline{\text{RAS}}$ Only Refresh

A $\overline{\text{RAS}}$ -only refresh cycle is the recommended technique for most applications to provide for data retention. A $\overline{\text{RAS}}$ -only refresh cycle maintains the outputs in the high-impedance state with a typical power reduction of 20% over a read or write cycle.

3. Hidden Refresh

A feature of the M5M4416P is that refresh cycles may be performed while maintaining valid data at the output pin by extending the $\overline{\text{CAS}}$ active time from a previous memory read cycle. This feature is referred to as hidden refresh.

Hidden refresh is performed by holding $\overline{\text{CAS}}$ at V_{IL} and taking $\overline{\text{RAS}}$ high and after a specified precharge period, executing a $\overline{\text{RAS}}$ -only cycling, but with $\overline{\text{CAS}}$ held low.

The advantage of this refresh mode is that data can be held valid at the output data ports indefinitely by leaving the $\overline{\text{CAS}}$ asserted. In many applications this eliminates the need for off-chip latches.

Power Dissipation

Most of the circuitry in the M5M4416P is dynamic, and most of the power is dissipated when addresses are strobed. Both $\overline{\text{RAS}}$ and $\overline{\text{CAS}}$ are decoded and applied to the M5M4416P as chip-select in the memory system, but if $\overline{\text{RAS}}$ is decoded, all unselected devices go into stand-by independent of the $\overline{\text{CAS}}$ condition, minimizing system power dissipation.

Power Supplies

The M5M4416P operates on a single 5V power supply.

A wait of some 500 μ s and eight or more dummy cycles is necessary after power is applied to the device before memory operation is achieved.

65 536-BIT (16 384-WORD BY 4-BIT) DYNAMIC RAM

ABSOLUTE MAXIMUM RATINGS

Symbol	parameter	Conditions	Limits	Unit
V _{CC}	Supply voltage	With respect to V _{SS}	-1~7	V
V _I	Input voltage		-1~7	V
V _O	Output voltage		-1~7	V
I _O	Output current		50	mA
P _d	Power dissipation	T _a = 25°C	700	mW
T _{opr}	Operating free-air temperature range		0~70	°C
T _{stg}	Storage temperature range		-65~150	°C

RECOMMENDED OPERATING CONDITIONS (T_a = 0~70°C, unless otherwise noted) (Note 1)

Symbol	Parameter	Limits			Unit
		Min	Nom	Max	
V _{CC}	Supply voltage	4.5	5	5.5	V
V _{SS}	Supply voltage	0	0	0	V
V _{IH}	High-level input voltage, all inputs	2.4		6.5	V
V _{IL}	Low-level input voltage, all inputs	-2.0		0.8	V

Note 1: All voltage values are with respect to V_{SS}.

ELECTRICAL CHARACTERISTICS (T_a = 0~70°C, V_{CC} = 5V ± 10%, V_{SS} = 0V, unless otherwise noted) (Note 2)

Symbol	Parameter	Test conditions	Limits			Unit
			Min	Typ	Max	
V _{OH}	High-level output voltage	I _{OH} = -2 mA	2.4		V _{CC}	V
V _{OL}	Low-level output voltage	I _{OL} = 4.2 mA	0		0.4	V
I _{OZ}	Off-state output current	Q floating 0V ≤ V _{OUT} ≤ 5.5V	-10		10	μA
I _I	Input current	0V ≤ V _{IN} ≤ 6.5V, All other pins = 0V	-10		10	μA
I _{CC1} (AV)	Average supply current from V _{CC} , operating (Note 3,4)	M5M4416P-12 RAS, CAS cycling			55	mA
		M5M4416P-15 t _o (rd) = t _o (w) = min, output open			50	mA
I _{CC2}	Supply current from V _{CC} , standby	RAS = V _{IH} , output open			4.5	mA
I _{CC3} (AV)	Average supply current from V _{CC} , refreshing (Note 3)	M5M4416P-12 RAS cycling CAS = V _{IH}			45	mA
		M5M4416P-15 t _o (Prd) = min, output open			40	mA
I _{CC4} (AV)	Average supply current from V _{CC} , page mode (Note 3,4)	M5M4416P-12 RAS = V _{IL} , CAS cycling			45	mA
		M5M4416P-15 t _o (Prd) = min, output open			40	mA

Note 2: Current flowing into an IC is positive, out is negative.

3: I_{CC1}(AV), I_{CC3}(AV), and I_{CC4}(AV) are dependent on cycle rate. Maximum current is measured at the fastest cycle rate.

4: I_{CC1}(AV) and I_{CC4}(AV) are dependent on output loading. Specified values are obtained with the output open.

CAPACITANCE (T_a = 0~70°C, V_{CC} = 5V ± 10%, V_{SS} = 0V, unless otherwise noted)

Symbol	Parameter	Test conditions	Limits			Unit
			Min	Typ	Max	
C _I (A)	Input capacitance, address inputs	V _I = V _{SS} f = 1MHz V _i = 25mV _{rms}			5	pF
C _I (OE)	Input capacitance, OE input				7	pF
C _I (W)	Input capacitance, write control input				7	pF
C _I (RAS)	Input capacitance, RAS input				10	pF
C _I (CAS)	Input capacitance, CAS input				10	pF
C _{I/O}	Input/Output capacitance, data ports				10	pF

65 536-BIT (16 384-WORD BY 4-BIT) DYNAMIC RAM

SWITCHING CHARACTERISTICS ($T_a = 0 \sim 70^\circ\text{C}$, $V_{CC} = 5V \pm 10\%$, $V_{SS} = 0V$, unless otherwise noted.) (Note 5)

Symbol	Parameter		Alternative Symbol	M5M4416P-12		M5M4416P-15		Unit
				Limits		Limits		
				Min	Max	Min	Max	
t _a (C)	Access time from $\overline{\text{CAS}}$	(Note 6,7)	t _{CAC}		60		75	ns
t _a (R)	Access time from $\overline{\text{RAS}}$	(Note 6,8)	t _{RAC}		120		150	ns
t _a (OE)	Access time from $\overline{\text{OE}}$	(Note 6)	—		30		40	ns
t _{dis} (CH)	Output disable time after $\overline{\text{CAS}}$ high	(Note 9)	t _{OFF}	0	25	0	30	ns
t _{dis} (OE)	Output disable time after $\overline{\text{OE}}$ high	(Note 9)	—	0	25	0	30	ns

- Note 5: An initial pause of 500 μs is required after power-up followed by any 8 $\overline{\text{RAS}}$ or $\overline{\text{RAS}}/\overline{\text{CAS}}$ cycles before proper device operation is achieved.
 Note that $\overline{\text{RAS}}$ may be cycled during the initial pause.
 And any 8 $\overline{\text{RAS}}$ or $\overline{\text{RAS}}/\overline{\text{CAS}}$ cycles are required after prolonged periods (greater than 2ms) of $\overline{\text{RAS}}$ inactivity before proper device operation is achieved.
 6: Measured with a load circuit equivalent to 2TTL loads and 100pF.
 7: Assume that $t_{\text{RCCL}} \geq t_{\text{RLCL}}$ max.
 8: Assume that $t_{\text{RLCL}} < t_{\text{RLCL}}$ max. If t_{RLCL} is greater than t_{RLCL} max then $t_a(\text{R})$ will increase by the amount that t_{RLCL} exceeds t_{RLCL} max.
 9: $t_{\text{dis}}(\text{CH})$ max and $t_{\text{dis}}(\text{OE})$ max define the time at which the output achieves the high impedance state ($I_{\text{OUT}} \leq \pm 10\mu\text{A}$) and are not reference to V_{OH} min or V_{OL} max.

TIMING REQUIREMENTS (For Read, Write, Read-Modify-Write, Refresh, and Page-Mode Cycles)

($T_a = 0 \sim 70^\circ\text{C}$, $V_{CC} = 5V \pm 10\%$, $V_{SS} = 0V$, unless otherwise noted, See notes 10,11)

Symbol	Parameter	Alternative Symbol	M5M4416P-12		M5M4416P-15		Unit
			Limits		Limits		
			Min	Max	Min	Max	
t _{C(RF)}	Refresh cycle time	t _{REF}		2		2	ms
t _{W(RH)}	RAS high pulse width	t _{RP}	90		100		ns
t _{RLCL}	Delay time, RAS low to CAS low (Note 12)	t _{RCD}	25	60	30	75	ns
t _{CHRL}	Delay time, CAS high to RAS low (Note 13)	t _{CRP}	−20		−20		ns
t _{SU(RA)}	Row address setup time before RAS low	t _{ASR}	0		0		ns
t _{SU(CA)}	Column address setup time before CAS low	t _{ASC}	0		0		ns
t _{H(RA)}	Row address hold time after RAS low	t _{RAH}	15		20		ns
t _{H(CLCA)}	Column address hold time after CAS low	t _{CAH}	20		25		ns
t _{H(RLCA)}	Column address hold time after RAS low	t _{AR}	80		100		ns
t _T	Transition time (rise and fall) (Note 14)	t _T	3	50	3	50	ns

- Note 10: The timing requirements are assumed $t_{\text{T}} = 5\text{ns}$.
 11: V_{IH} min and V_{IL} max are reference levels for measuring timing of input signals.
 12: t_{RLCL} max is specified as a reference point only; if t_{RLCL} is less than t_{RLCL} max, access time is $t_a(\text{R})$; if t_{RLCL} is greater than t_{RLCL} max, access time is $t_{\text{RLCL}} + t_a(\text{C})$. t_{RLCL} min is specified as t_{RLCL} min. = $t_{\text{H}}(\text{RA}) + 2t_{\text{T}} + t_{\text{SU}}(\text{CA})$.
 13: t_{CHRL} requirement is only applicable for $\overline{\text{RAS}}/\overline{\text{CAS}}$ cycles preceded by a $\overline{\text{CAS}}$ only cycle (i.e., For systems where $\overline{\text{CAS}}$ has not been decoded with $\overline{\text{RAS}}$).
 14: t_{T} is measured between V_{IH} min and V_{IL} max.

Read and Refresh Cycles

Symbol	Parameter	Alternative Symbol	M5M4416P-12		M5M4416P-15		Unit

t _{DOEL}	Delay time, Data to OE low	—	0		0		ns
t _{OEHD}	Delay time, OE high to Data	—	25		30		ns

Note 16: $t_{C(rdW)}$ is specified as $t_{C(rdW)} \text{ min} = t_a(R) \text{ max} + t_{OEHD} \text{ min} + t_{H(WRH)} \text{ min} + t_{W(RH)} \text{ min} + 4 t_r$.

17: $t_{SU(WCL)}$, t_{CLWL} and t_{RLWL} are specified as reference points only. If $t_{SU(WCL)} \geq t_{SU(WCL)} \text{ min}$, the cycle is an early write cycle and the DQ pins will remain high impedance throughout the entire cycle. If $t_{CLWL} \geq t_{CLWL} \text{ min}$ and $t_{RLWL} \geq t_{RLWL} \text{ min}$, the cycle is a read-modify-write cycle and the DQ will contain the data read from the selected address. If neither of the above condition is satisfied, the condition of the DQ (at access time and until $\overline{CAS}$ or $\overline{OE}$ goes back to V_{IH}) is indeterminate.
